# Pesticides for Home Gardeners

RHS Gardening Advice  
March 2019

---

**The mention of any product, supplier or service does not constitute an endorsement by the RHS Gardening Advice.** It is a list of products available to the home gardener.

The RHS statement on pesticides in horticulture and how gardeners can help bees and other pollinators by avoiding the use pesticides can be found at <https://www.rhs.org.uk/about-the-rhs/policies/pesticide-statement>

Trained staff are present, by law, in larger retail outlets who can give good advice on what products to buy, how to use them and alternative methods of control.

## Introduction

UK and European Union (EU) legislation requires approval at EU level for active ingredients used in all pesticides, including those for home garden use. Member states then approve products containing allowed ingredients. Products approved in the UK are assigned a registration number, printed on the packaging – MAPP numbers for pesticides for use on plants and HSE numbers for household products. Products with currently listed numbers are approved and considered safe if used in accordance with the manufacturer's instructions. To check MAPP numbers, see <https://secure.pesticides.gov.uk/garden/prodse/arch.asp> and for HSE numbers, see [www.hse.gov.uk/biocides/copr/approved.htm](http://www.hse.gov.uk/biocides/copr/approved.htm) Technically the definition of pesticides also includes fungicides and weedkillers, this leaflet only covers pesticides that control animals (primary insects and mites) that affect garden and house plants. Information on weedkillers and fungicides are available separately. Some products listed in this leaflet, for example plant extracts which act by physical means, are not considered pesticides and do not always require approval.

**To use pesticides safely the following rules should be observed:**

- **Avoid the use of pesticides, use them only when really necessary.** Tolerate some damage and use cultivation techniques such as rotation of crops or hand removal. Using biological controls and encouraging natural enemies can reduce or eliminate the need for spraying.
- **Do not spray open blooms because of the danger to bees, butterflies and other pollinators.**
- Identify the problem correctly in order to apply appropriate control.
- Select a pesticide that is recommended for the purpose; always read the label before choosing a product. Do not purchase large amounts of pesticide that will take years to use up. If only a few plants require treatment, a ready-to-use formulation may be the most appropriate.
- Read the manufacturer's instructions and check for any limitations or specific precautions you should take. As an added safety measure you could wear rubber gloves when applying or handling pesticides.
- Avoid contact with exposed parts of the body, particularly the eyes and mouth. Wash off any splashes immediately.
- Avoid breathing in sprays, for example by standing up-wind while treating.
- Wash after using pesticides.
- Do not smoke, eat or drink while applying pesticides.
- Make sure no one or pets are nearby when spraying and keep them away until the foliage is dry.
- Follow all the manufacturer's instructions and apply the pesticide at the stated rate

Online [www.rhs.org.uk/myadvice](http://www.rhs.org.uk/myadvice) Tel 01483 479700 (Mon-Fri, 10am-1pm) Follow us on    
Write to RHS Gardening Advice, RHS Garden Wisley, Woking, Surrey GU23 6QB

and in the manner described. It is a legal requirement to comply with the Statutory Conditions on the label.

- Spray at the correct times and intervals as this is often crucial for effective control.
- When spraying an edible plant, check that the pesticide is suitable for that plant and note the instructions for the period of time that must be left between treatment(s) and harvest (harvest interval) and the maximum number of applications permitted per growing season.
- It is illegal to mix two pesticides together unless the manufacturer indicates that this is permissible. Some products are sold as combined insecticide/fungicide for use on ornamental plants.
- Spray plants thoroughly, including stems, buds and the underside of leaves but without excessive run-off or drift.
- Do not spray plants that may be damaged by pesticides or allow spray to drift on to them. Because of the large numbers of species and cultivars of ornamental plants grown in gardens and greenhouses, sensitivity to products should always be checked on a small area or number of plants.
- To avoid drift and potential plant damage do not use pesticides in wet, windy, completely calm or hot sunny weather, or when plants are suffering from drought. Spray in the early morning, late afternoon or evening.
- All pesticides pose a risk to fish, amphibians and other pond life. Keep pesticides, away from ponds, ditches, streams and other water bodies.
- Clean all equipment after spraying. Do not apply pesticides with apparatus that has been used for weedkillers.
- Store pesticides in a cool, safe place away from children and pets, keeping them tightly closed and in their original containers.
- Dispose of unwanted or out-of-date pesticides by taking them to a manned local authority household waste site where

they should be handed over to the staff. For information on waste disposal sites see [www.garden-care.org.uk](http://www.garden-care.org.uk)

## Choosing pesticides available to home gardeners

This leaflet is not a complete list pesticides available to home gardeners but it includes most widely available products. Some active ingredients listed under manufacturers' brand names may be available from some outlets as "own brand" products. It is not practicable to list these. Check the label carefully to confirm the active ingredient.

The following list of retail packs has been drawn up to assist gardeners in choosing pesticides. Proprietary products sold for the control of insects and mites are listed under the chemical name of their active ingredient. Manufacturers of pesticides subject to regulations made under UK legislation are obliged by law to print the name of the active ingredient on the label but this may be in small print. It is emphasised that the RHS is not liable in any way for any consequences that may ensue from the use of these products.

The lists of insects and mites controlled given under the names of the active ingredients are for guidance only. The instructions for the products' use must be read carefully and followed. Harvest intervals (the period of time that must elapse between treatment and harvesting edibles) are not given in this leaflet and reference must be made to the product label. Products with the same active ingredient may vary in the range of pests controlled and the plants on which they can be used.

Products for control of mammal pests such as mice and rats are not included on this leaflet. Products for controlling pests which do not directly affect plants are also not included.

Further details about most of the products listed can be obtained from The Common Sense Gardening Group of the Crop Protection Association ([www.garden-care.org.uk/about](http://www.garden-care.org.uk/about)) . Further information on pesticide approvals and safe use can be obtained from <http://www.hse.gov.uk/pesticides/user-areas/garden-home.htm> .

## Products available to home gardeners

### Key

\* These active ingredients are fungicides. Detail are given in [Fungicides for Home Gardeners](#)

RTU Ready to use sprays

### 1. Natural (organic) insecticides

These products are derived from plants or other natural substances. They are contact in action and require thorough application, especially to the undersides of leaves. They can affect a broad range of small invertebrates, including some beneficials if they are present at the time of treatment. The short persistence of these compounds may mean that frequent applications are required. They are safe to use on most plants, including listed fruits and vegetables which can be treated close to harvest (see label instructions).

#### a) Natural pyrethrum/pyrethrins

Derived from the flowers of *Tanacetum cinerariifolium*. Broad spectrum insecticide, that can control a wide range of insects including whitefly, small caterpillars, aphids, thrips, leafhoppers, capsids, ants and some beetles.

---

Sprays	<b>Bug Clear Gun for Fruit &amp; Veg</b> RTU <b>Bug Clear Ultra 2 Gun</b> RTU (also contains vegetable oils) <b>Bug Clear Ultra 2 concentrate</b> (also contains vegetable oils) <b>Neudorff Bug Free Bug and Larvae Killer</b> RTU and concentrate (also contains vegetable oils) <b>Neudorff Bug Free Bug and Larvae Killer for Roses</b> RTU (contains vegetable oils) <b>Ecofective Bug Killer</b> RTU, also contains fatty acids
Dusts & Granules	<b>Py Insect Killer Powder</b>

---

#### b) Fatty acids (insecticidal soaps)

For use against aphids, whitefly, thrips, mealybugs, scale insects, leafhoppers and red spider mite.

---

Sprays	<b>Solabiol Bug Free</b> RTU <b>Doff Greenfly and blackfly bug Killer</b> RTU <b>Doff Universal Bug Killer</b> RTU
--------	--

---

#### c) Plant oils and extracts

Refined plant oils, such as those derived from rape seed and sunflower, which block the breathing pores (spiracles) of small insects and mites, including aphids, whitefly, thrips, mealybugs, scale insects and red spider mite. Bees and ladybirds are less likely to be harmed. No harvest interval required but do not use on fuchsia or begonia. Also available as winter wash for use against overwintering aphid eggs on dormant deciduous fruit trees and bushes.

---

Sprays	<b>Growing Success Winter Tree Wash</b> <b>Vitax Plant Guard Pest &amp; Disease Control</b> RTU & Concentrate (contains fish oils) <b>BugClear Fruit and veg</b>
--------	--

---

#### d) Garlic extract

Products based on garlic available as a fumigant for dispersing insect pests in glasshouses

---

Fumigant	<b>Pest-Stop Biofume Greenhouse Fumigator</b>
----------	---

---

#### e) Seaweed extract

Products based on seaweed with a physical action for control of glasshouse whitefly

---

Spray	<b>Agralan Whitefly Killer</b>
-------	--------------------------------

---

## 2. Compounds with a physical mode of action (not-organic)

### Plant invigorators

Consisting of blends of surfactants and nutrients or fatty acids and algae extracts, plant invigorators aid the optimal nutrition of plants and help control whitefly, aphids, mealybugs and red spider mite as well as some plant diseases. Healthy plants are more resistant to pests and diseases and the invigorators give some control by a sticking and a washing process.

---

Spray	<b>Ecofective House Plant Defender 3 in 1 RTU</b> <b>Ecofective Rose Defender 3 in 1 RTU and concentrate</b> <b>Neudorff Plant Invigorator RTU</b> <b>SB Plant Invigorator RTU and concentrate</b> <b>Westland Resolva Natural Power Bug &amp; Mildew</b>
-------	---

---

## 3. Synthetic insecticides: contact action

### Synthetic pyrethroids

Contact and broad spectrum, effective against a wide range of insects including aphids, whiteflies, leafhoppers, thrips, beetles, ants and small caterpillars. By making alterations to the molecular structure of natural pyrethrum, synthetic photostable pyrethroid compounds, such as **cypermethrin**, **phenothrin**, **lambda-cyhalothrin**, **deltamethrin**, **tetramethrin** and **permethrin**, were developed. These synthetic pyrethroids retained the low mammalian toxicity of other pyrethroids but can remain active against some pests for several weeks. Other pyrethroids break down quickly in sunlight losing their activity within days. Some products can be used on listed food plants.

#### a) Deltamethrin

A spray concentrate and ready to use for controlling aphids, whitefly, caterpillars, codling moth, plum moth, tortrix moths, raspberry beetle, flea beetles, weevils, sawfly larvae, apple and pear suckers, leafhoppers, capsid bugs, scale insects and mealybugs on ornamental plants and a wide range of listed edibles.

---

Sprays	<b>Baby Bio Houseplant Bug Killer RTU</b> <b>Provanto Ultimate Bug Killer RTU and concentrate</b> <b>Provanto Ultimate Fruit &amp; Vegetable Bug Killer RTU and concentrate</b> <b>Provanto Sprayday Greenfly Killer</b> <b>Toprose Bug Killer RTU</b>
--------	--

---

#### b) Lambda-cyhalothrin

A concentrate and ready to use spray for controlling aphids, capsid bug, thrips, whitefly, beetles, caterpillars, pea moth, pea and bean weevil, sawflies, leaf curling midges, carrot fly adults and some other insects. Can be used on ornamental plants and a wide range of listed fruits and vegetables.

---

Sprays	<b>Westland Resolva Bug Killer RTU and concentrate</b>
--------	--

---

#### c) Cypermethrin

Available as a ready to use spray and concentrate for application to a wide range of ornamental and edible plants. There is also a ready to use spray for aphid control with a fungicide that is effective against rose rust, blackspot and powdery mildew that can be used on ornamental plants.

---

Sprays	<b>Py Bug Killer RTU and concentrate</b> <b>Doff Rose Shield Bug &amp; Fungus Killer RTU (+ myclobutanil*)</b> <b>Rose Clear Ultra Gun 2 RTU (+ myclobutanil*)</b> <b>Vitax Rosegarde RTU (+ myclobutanil*)</b>
--------	--

---

#### d) Permethrin

Smoke formulations for use against aphids, whitefly and other insects in greenhouses.

---

Smoke	<b>Deadfast Greenhouse Smoke Generator</b> <b>DeadFast Greenhouse Smoke Fumigator</b> <b>Vitax Greenhouse Fumigator</b>
-------	---

---

#### 4. Synthetic insecticides: systemic action

Systemic insecticides are absorbed into plants through the roots and/or foliage, they usually also have contact action. Invertebrates are affected when they feed on the treated roots and/or foliage. The two active ingredients still available in this section are neonicotinoid pesticides.

##### Withdrawal of imidacloprid and thiamethoxam

Two neonicotinoid pesticides that were available to the home gardener (imidacloprid and thiamethoxam) were withdrawn in 2013. Following concern over their effects on bees and other pollinators the European Commission restricted their use whilst further evidence was gathered and evaluated. In April 2018 the withdrawal was made permanent and extended to include plants that are either not pollinated by bees such as cereal crops, which are wind pollinated, or ones that are harvested before they flower such as sugar beet in outside spaces. This withdrawal of approval will become effective before the end of 2018. Imidacloprid and thiamethoxam may still be used by professional growers on plants grown in a fully enclosed greenhouse environment with stringent conditions that prohibit treated plants being put outside until they have finished flowering, nor planted in the soil until nine months have elapsed after growing medium treatment. Two other neonicotinoids, both considered of lower bee toxicity, remain available to professional growers; acetamiprid and thiacloprid. Only acetamiprid is available to home gardeners. It is illegal to use unapproved products and these should be taken to a local authority household waste site where they should be handed over to the staff.

For information on waste disposal sites see [www.garden-care.org.uk](http://www.garden-care.org.uk). It remains legal to use other neonicotinoid-based products that are not affected by the withdrawal, listed below.

##### a) Acetamiprid

A broad spectrum, systemic and contact action pesticide for use as a foliar spray on ornamental plants. Some formulations can be used on tomato, aubergine, pepper, potato, lettuce, apple, pear, cherry and plum. Also as a compost drench on container grown ornamental plants, primarily against vine weevil grubs. This pesticide also controls aphids, whitefly, scale insects, mealybugs and thrips. The spray formulations can also be used against red spider mite, lily beetle and caterpillars. Sprays containing the fungicide triticonazole also control mildew, rust and blackspot on roses.

---

Sprays	<b>Bug Clear Ultra</b> concentrate <b>Rose Clear Ultra</b> concentrate (+ triticonazole*) <b>Bug Clear Ultra Gun</b> RTU <b>Rose Clear Ultra Gun</b> RTU (+ triticonazole*) <b>Rose Clear Ultra concentrate</b> (+ triticonazole*)
Compost drench	<b>Bug Clear Ultra Vine Weevil Killer</b>

## 5. Slug control pesticides

In addition to the chemicals listed below for controlling slugs and snails, there are many products available that deter or act as a barrier to these pests. Further details of these products are given in the advisory information on “Slugs and Snails” <https://www.rhs.org.uk/advice/profile?PID=228>

### a) Ferric (iron) phosphate

A pelleted bait for use against slugs and snails. Less toxic to birds and mammals than metaldehyde and is approved for use by organic growers around ornamental and edible plants.

---

Pellets	<b>Solabiol Slug Killer</b> <b>Doff Super Slug Killer</b> <b>Growing Success Slug Killer Advanced</b> <b>SlugClear Ultra<sup>3</sup></b> <b>Sluggo Slug &amp; Snail Killer</b> <b>Sluggo Slug &amp; Snail Killer Ultra</b> <b>Vitax Slug Rid</b> <b>Westland Erazo Zero Slug Killer</b>
---------	--

---

### b) Metaldehyde

Metaldehyde will be withdrawn in 2020. In December 2018 DEFRA announced that metaldehyde will be banned from most uses in Spring 2020. The ban includes all home garden use. The decision followed advice from the UK expert committee on Pesticide and the Health and Safety Executive (HSE) who considered that metaldehyde poses an unacceptable risk to birds and mammals. Until the ban comes into force products containing metaldehyde continue to be used although they may become unavailable in the supply chain.

Used as pelleted baits or a liquid for watering on to the soil against slugs and snails. Toxic to pets if eaten, especially cats and dogs. Pellets can be used around ornamental and edible plants but keep them off the foliage and scatter thinly on the soil. The liquid formulation can be applied with a watering can and rose to ornamental plants and the soil, but not near edible plants.

---

Pellets	<b>Ultimate Slug &amp; Snail Killer</b> – Marketed by SBM Life Science <b>Garden Protect Slug &amp; Snail Killer</b> – Marketed by SBM Life Science <b>Doff Slug Killer Blue Mini Pellets</b> <b>Westland Erazo Slug and Snail Killer</b>
